**REPRODUCTIVE/DEVELOPMENTAL EFFECTS:** (Based on Forchlorfenuron technical)

The only effects observed in a developmental study in rats were increased incidence of alopecia and decreases in maternal and fetal body weights at the highest dose tested. The effects in reproductive/offspring based on pup mortality, emaciation, and decrease in pups/litter occurred at the same or higher doses at which effects were observed in the parental animals. No evidence of increased qualitative or quantitative susceptibility.

**CHRONIC/SUBCHRONIC EFFECTS:** (Based on Forchlorfenuron technical)

In subchronic and chronic dog studies, dose-related effects were generally limited to decreased body weight and body weight gains. In rats, the only organ that appeared to be affected was the kidney, which showed supportive inflammation in males and non-supportive interstitial nephritis in females only in a 2-year rat study.

**CARCINOGENICITY:** (Based on Forchlorfenuron technical)

Carcinogenicity studies indicated no evidence of an increase in the incidence of tumors in either the rat or the mouse, and Forchlorfenuron has been classified as not likely to be a human carcinogen.
